

Quik-Therm CIS System Testimonial

AMAZING NEW INSULATION SYSTEM

My son in law & I (both Do It Yourselfer's), together with the guidance from Ryan from Quik-Therm transformed a 1200 sq. ft. basement space from a cold, damp & mould infested area to a warm, dry & clean space using Quik-Therm insulation on the interior basement walls.

PREPARATION :

The preparation was the toughest. The poly, mouldy fiberglass & wood stud framing were removed & the concrete walls washed to remediate all the mould. Time consuming but necessary to give us a clean starting point.

PRODUCT & INSTALLATION:

This was the easy part. The polymer laminated 4' x 8' tongue & groove insulation panels were light, joined together easily & attached to the concrete walls quickly. When necessary, cutting the panels to size was a breeze. Canned spray foam was used to seal the sill plates & panel joints providing a complete vapour barrier. No hazardous materials nor itchy fiberglass to handle. Levelling the metal stud walls was effortless using the joist & floor metal plates. The vertical metal studs attached to insulation panels using clips & self tapping screws. The roughed in wall system accommodates electrical installation. After the drywall was attached to the metal studs the wall felt strong & rigid.

BENEFITS:

The Quik-Therm panels are slightly more expensive than fiberglass, however the installation savings would be greater than the product cost differential.

As well , Quik-Therm insulation value exceeds codes, is Government approved & qualifies for Manitoba Hydro Energy Savings Program. We expect to realize some energy cost savings.

RECOMMENDATION:

This is an ingeniously designed CANADIAN insulation system that was a perfect solution to our basement problems. It's truly an innovative product supported by very helpful staff. I would highly recommend Quik-Therm to anyone considering an insulation project.
